TITLE: Mechanical Processing of Aluminum Alloys (Mekhanicheskaya obrabotka alyuminiyevykh splavov)

PERIODICAL: Avtomobil'naya Promyshlennost', 1958, Nr 3, pp 29-31 (USSR)

ABSTRACT: In the production of small automobiles, like the Soviet "Volga", aluminum is mainly used. In this car 40 parts are made from aluminum e.g. the cylinder block, the piston, gear cases, bearing covers, various chassis parts, etc. The aluminum alloys mostly used are silumin AL4 for cast parts, duralyumin D1 for forged or turned parts, and a special heat-resistant copper-silicon alloy for the pistons. In the table, the chemical composition of these alloys is given. The mechanical processing of aluminum alloys is easier after tempering and aging. In this state the materials have a greater hardness and are less viscous. The higher heat conductivity permits higher speeds in the processing, but the extension of aluminum when heated is two times larger than in steel. The exactness in the processing is therefore lower. Measuring instruments are often made from materials with the same expansion factor as aluminum, to counter-balance this effect. For highly productive processing of

TITLE: Machinability of Cold-Drawn Steels on Automatic Lathes  
(Obrabatyvayemost' kholodnotyanutykh staley na tokarnykh  
avtomatakh)

PERIODICAL: Vestnik Mashinostroyeniya, 1959,<sup>39</sup> Nr 3, pp 57-61 (USSR)

ABSTRACT: Turning and drilling trials were carried out on a number of cold-drawn steels of types frequently turned on automatic lathes for making automobile components. The ends of the bars were face turned with varying rates of cross feed using a constant 5 mm width of cut. An average diameter,  $d_{cp}$ , for which a constant speed of cutting for a given number of revolutions would show the same tool wear as with the variable cutting speed actually experienced, was calculated from formula (1). The index,  $k$ , in this formula is the tangent of the slope of the curve for tool life versus number of revolutions, when plotted on a logarithmic scale. Graphs of Figs 1 and 2 were constructed for tool life (minutes) versus average cutting velocity (metres/min) for different steels and different rates of cross feed. Using the cutting speed

Card 1/3

SOV/122-59-3-17/42

Machinability of Cold-Drawn Steels on Automatic Lathes

at which a tool life of 100 minutes was obtained with the A.12 steel, at any given rate of feed, as an index equal to 1, the relative machinability of other cold-drawn steels can be compared as shown in Table 1. Formulae (3) and (4) give an approximate relation between cutting speed, tool life and cross feed for face turning of the A.12 or A.20 steels. Drilling tests were carried out similarly, but in this case for 20 minute life until the drill had become blunted by 0.7 mm; again using the A.12 steel as an index of 1, other steels are compared as shown in Table 2. Formulae (5) and (6) relate cutting speed to drill life, drill diameter and rate of feed. The tangential force on tools with straight, stepped, convex and concave profiles was measured when face turning at a constant speed of 30 metres/min. The results, expressed as force (kg) per mm of tool width, are tabulated for different rates of feed for various cold-drawn steels in Table 3. Force for the A.12 steel is about 25% less than for all other steels. Ball-bearing quality steel, ShKh-15, gave the best class of surface finish at rates of feed from 0.04 to 0.1 mm/rev. Finish deteriorates

Rezhimy rezaniya na tokarnykh avtomatakh (Cutting Regimes for Operations On Automatic Lathes) Moscow, Mashgiz, 1960. 329 p. Errata slip inserted. 13,000 copies printed.

Managing Ed. for Literature on the Economics and Organization of Machine Building (Mashgiz): T. D. Saksaganskiy, Engineer; Ed.: I. I. Pinegin; Tech. Ed.: T. F. Sokolova.

PURPOSE: This book is intended for the technicians, designers, machine-operation time standard setters and foremen of mechanical shops, and also for the setup-men of automatic lathes.

COVERAGE: The book includes methods for calculating cutting regimes of single-and multiple-spindle automatic lathes. Reference data are given on recommended feeds and cutting speeds and on the kinematics and dynamics of the most popular models of automatic lathes. Standards for cams (of the multiple-spindle automatic lathes) and instructions for design ( of single-spindle automatic lathes) are

Card 1/3

TITLE: Hydropneumatic suspension for high-power automobiles

SOURCE: Avtomobil'naya promyshlennost', no. 8, 1965, 20-22

TOPIC TAGS: motor vehicle, vehicle engineering, vehicle component, pneumatic device

ABSTRACT: The Bryansk Automobile Plant (Bryanskiy avtozavod) developed jointly with the Gor'kiy Polytechnic Institute (Gor'kovskiy politekhnicheskiy institut) a hydropneumatic suspension for high-power 8 x 8 automobiles with a gross weight exceeding 10 t. The suspension is independent, has an automatic body control (three positions), and a variable clearance. The design of the front end suspension is shown as Fig. 1. The article gives a detailed description of the system, including the design of the hydropneumatic spring, its operating parameters, the suspension characteristic, and the shock-absorber characteristic. Orig. art. has: 6 figures and 1 table.

TITLE: Effective Dredge Operation in Winter (Effektivnyye metody organizatsii drazhnykh rabot v zimnikh usloviyakh)

PERIODICAL: Kolyma, 1956, Nr 4, pp 25-29

ABSTRACT: High-output methods of removing ice from the dredge cut, and methods of preventing ice formation are described. Before dredging is started after the idle winter period, it is necessary to free the dredge operating area, which may be from 4,500 to 50,000 m<sup>2</sup> in size, of ice. Use of the ELM-2 and DLM-1 ice-cutting machines is recommended. The ELM-2 ice-cutting machine is capable of successful employment in the dredging area. For purposes of winter overhaul it is desirable that the dredge be moored at the edge of the area of operation so that the various dredge assemblies may be stored outside the work area. This makes it possible to preserve the snow cover on the area to be dredged and thus prevent freezing in depth of the ground. A frame-carrying high-speed winch is a desirable means of removing ice from the area to be dredged. The Authors recommend

SOURCE: Izobreteniya, promyshlennyye obraztzy, tovarnyye znaki, no. 23, 1966, 76-77

TOPIC TAGS: oceanographic instrument, electromeasuring device, phased array antenna

ABSTRACT: This Author Certificate presents a device for recording ocean swells, which contains a rotating girder mounted on a base with electric contact sensors mounted on it, connected to a power supply and a recorder. To record swells differing in direction of propagation, the contact sensors are in the form of a bundle of insulated leads. The lower bare ends of the leads are distributed uniformly in height within the limits of oscillation of the water level. The upper ends are connected through single resistors to the power supply and recorder (see Fig. 1). The leads are placed on the rotating girder so as to form a phased antenna array.

TITLE: Measurement of the two-dimensional spectrum of waves

SOURCE: Okeanologiya, v. 5, no. 6, 1965, 1089-1094

TOPIC TAGS: ocean dynamics, oceanographic instrument, spectrum analysis

SUB CODE: 08

ABSTRACT:

The authors describe a method and apparatus which make it possible to obtain separate records of waves arriving from any specified sector of the sea surface. Having such a set of records, using well-known computation methods or spectral analysis apparatus, it is possible to obtain the two-dimensional energy spectrum of waves. If such separate records of waves are obtained periodically, it is possible to detect the principal sources of waves (storm regions), trace the development of waves and the movement of storm regions on the basis of the change in the two-dimensional spectrum. Using an analytical method such as that proposed by Munk, these data also can

V verkhnikh sloyakh atmosfery (In the Upper Layers of the Atmosphere)  
[Belgorod] Belgorodskoye knizhnoye izd-vo, 1959. 60 p. 1,500 copies printed.

Ed.: Z.T. Prokopenko; Tech. Ed.: V.A. Kotlyarenko.

PURPOSE: This book is intended for the general reader.

COVERAGE: The author describes the conquest of space by man in popular terms. An analysis of the basic scientific principles governing the flight of rockets and artificial satellites is given and progress in the study of the upper atmosphere by means of these devices is outlined. The possible nature of man's life on space stations and other planets in the future is discussed. A brief section is devoted to problems of international law created by the flight and operation of satellites. There are 19 references, all Soviet.

TITLE: Prospects for using thin-film diodes in measuring instruments

SOURCE: Avtometriya, no. 6, 1965, 36-44

TOPIC TAGS: semiconductor diode, thin film diode, measuring instrument

ABSTRACT: Three types of thin-film diodes<sup>25</sup> are in use: (1) Diodes with space-charge-limited current; (2) Diodes with oxide films whose functioning depends on metal-oxide-boundary phenomena; (3) Heterojunction diodes. Their principal characteristics and the physical phenomena transpiring in them are discussed. The results of an experimental investigation of the second and third types with 0.01 and 0.0003 cm<sup>2</sup> active surface (9 diodes per cm<sup>2</sup>) are reported. Current-voltage characteristics of Ti-oxide-film diodes are shown; these diodes can operate at temperatures up to 200C; their characteristics do not deteriorate with time (2.5 yrs). CdS heterojunction diodes exhibit very steep characteristics; at 0.2-0.4 v, their forward currents are considerable; at -3-4 v, their reverse currents are 10-40 microamp. At temperatures over 100C, their reverse current rapidly increases. After 100 hrs of continuous operation, the forward current (initially 2 ma) increased by

Starostin, N. V., Chumakov, N. I.

TITLE:

Acceleration of  $\text{He}_3$  to 35 Mev in the 150-cm cyclotron

PERIODICAL:

Atomnaya energiya, v. 11, no. 3, 1961, 213-216

TEXT: The fact that, on the one hand,  $\text{He}_3$  nuclei are much used as bombarding particles, while, on the other, considerable losses occur when they are accelerated in standard cyclotrons, caused the authors to develop a "return system" which was tested on the cyclotron of the Ordena Lenina Institut atomnoy energii im. I. V. Kurchatova (Order of Lenin Institute of Atomic Energy imeni I. V. Kurchatov). A description of this system is given. Fig. 1 shows a diagram of this so-called "gas return system". The gas is pumped from a cylinder into the system by a pump that automatically controls the flow rate at regulated pressure (100-200 mm Hg). Most of the gas is evacuated by two diffusion pumps and a forepump, and after compression is again fed into the  $\text{He}_3$  system over a

Acceleration of  $\text{He}_3$  to 35 Mev ...

system of traps. The traps retain the various impurities contained in the gas (oil, water, nitrogen, oxygen, Hg). All possible ways are employed to reduce gas leakage and infiltration of impurities into the gas cycle. The mechanical pumps have water-cooled oil battle. This gas return system makes it possible to reduce  $\text{He}_3$  losses to  $5 \text{ cm}^3/\text{hr}$ . The highest energy to which  $\text{He}_3$  ions can be accelerated is determined by the highest attainable frequency of the resonant circuit, namely, 11.2 Mc/sec. A magnetic field strength of 11,000 oe corresponds to this frequency. On a 67-cm radius  $\text{He}_3^{+2}$  ions attain about 35 Mev. To prevent ion losses during acceleration, and during deflection from the magnetic field, focusing diaphragms are provided on the duants. The ion source is moved to a predetermined distance from the magnetic field center. Measurement of the dependence of the ion current on acceleration radius has shown that from 40 cm onwards, no more ion losses occur. A system of hyperbolic electrodes serves to deflect the ions. The ion current on a target at 12 m distance from the cyclotron has the following parameters: energy of  $\text{He}_3^{+2}$  ions: 35 Mev;

energy spread:  $\pm 0.3\%$ ; half-width of beam on target: 8 mm (horizontal) and  $< 8$  mm (vertical); mean amperage: 30  $\mu$ a. 10  $\mu$ a is normally used. N. A. Vlasov and S. P. Kalinin are thanked for their interest, V. I. Lamunin and N. N. Khaldin for constructing the gas return system, N. V. Kartashov for adjusting the pulsed supply of the ion source. TITLE: A Piston Pressure Gauge for use up to 20,000  
Atmospheres (Porshnevoy manometr do 20 000 am)

PERIODICAL: Pribery i tekhnika eksperimenta, 1959, Nr 3,  
pp 118-122 (USSR)

ABSTRACT: A pressure amplifier is used in the gauge, which is seen in Fig 1. The piston 1 fits closely in the cylinder 2, which is held in the double jacket 3. Cylinder 2 is held by screwed ring 4, which compresses the seal 5, which has an unbalanced area. The piston is coupled to the low-pressure piston via a ball joint; this latter piston lies in cylinder 7, which is joined firmly to body 3 to make the two cylinders strictly coaxial. The pulley 8 sets the pistons turning to overcome friction. The head 10 contains a valve 11 and viewing ports, and holes for connecting a piston gauge 12 with load 13. A hole in 10 joins 12 to 11; this communication can be cut off. The indicator 14 is used to measure the position of the piston. (The gain of the multiplier Card 1/3 is about x 280). Fig 2 shows a system used to produce

TITLE: Effect of neutron irradiation on aminotransferase activity of the central nervous system and skeletal muscle.

SOURCE: Ukrayins'kyi biokhimichnyy zhurnal, v. 38, no. 3, 1966, 258-263

TOPIC TAGS: relative biological efficiency, gamma irradiation, biologic metabolism, central nervous system

ABSTRACT: Mature albino rats weighing 160-220 g were irradiated with 13-rad  $\gamma$ -ray doses filtered through 4.5 cm borium carbide and 50 cm iron. Reactor power was 1000 kv. Neutron energy ranged from 0.04 Mev to 1.35 Mev. Rats were kept in a plexiglass container and given a 13-rad dose for 60 min. Examinations were made on the 1st, 3d, 15th, and 30th day. The rats were decapitated, and their organs were removed, treated, and homogenized in the cold with pH 7.5 phosphate buffer. Activity of L-aspartate (2-oxoglutarate-aminotransferase, 2.6.1.1) and L-alaninketoacid aminotransferase systems was determined by the Umbreit method, except that the latter compound (a mixture

UDC: 577.391

Card 1/2

L 32920-66

ACC NR: AP6019752

of homogenate and substrate) was incubated 20 min. Activity was calculated in colorometric units/g of raw tissue and results were statistically analyzed. Enzyme activity was affected in the cerebral cortex, cerebellum, spinal cord, and musculus gastrocnemius; it was irregular and uncoordinated, and evident in the coefficient changes denoting the relation between the two systems. It was concluded that irradiation of albino rats with neutrons of intermediate energies in doses of 13 rad leads to changes in the activity of aspartate aminotransferase and alanine aminotransferase in the cerebral cortex, cerebellum, spinal cord, and skeletal muscle. These changes are characterized both by a rise and fall in the transaminizing enzymes and by the discoordination of the enzyme system. Orig. art. has: 3 tables and 2 figures. [14]

AUTHOR: ~~Konysh~~ev, P. I., Senior Master

TITLE: A Shield for Protecting the Winding of an Electric Motor from Damage During Its Assembly (Shchitok dlya predokhraneniya ot povrezhdeniya obmotki elektrodvigatelya pri yego sborke)

PERIODICAL: Energetik, 1959,<sup>7</sup> Nr 4, pp 17 - 18 (USSR)

ABSTRACT: The author suggests the application of a removable shield to be used during the assembly of electric motors of series A and AK (exceeding 100 kw, 6000 or 3000 v) for protecting the stator coils from damage by the rotor. Figure 2 shows the shield, and Figure 3 the method of application. The shield is placed onto the front end of the stator coils and the rotor will pass thru it. There are 3 diagrams.

TITLE: On Compounds of Luteo Phosphotungstic Acid With Urea and Glycocoll (O soyedineniyakh lyuteofosfornovol'framovoy kisloty s mochevinoy i glikokolem)

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 2, pp 357-364 (USSR)

ABSTRACT: The compounds of the above acid  $H_{12}[P_2O_2(W_2O_7)_9] \cdot xH_2O$  (herein after called l.f.w.) with nitrogenous organic bases are only sparsely discussed in publications. Rosenheim and Jaenicke (Ref 1) synthesized the triple-substituted salt of guanidine from the empirical formula  $3(CN_3H_6)O \cdot P_2O_5 \cdot 18WO_3 \cdot 10H_2O$ , which was obtained in the form of yellow prisms. The action of 5 mol caustic soda and an excess of guanidine chloride upon the free acid yielded a difficultly soluble guanidine salt, which separated from the solution in the crystalline state as a compound of the empirical formula  $5(CN_3H_6)_2O \cdot P_2O_5 \cdot 18WO_3 \cdot 18H_2O$ . In this respect, the l.f.w. solution differs considerably from the phosphotungstic acid of the saturated series  $H_7[P(W_2O_7)_6] \cdot xH_2O$ , which has been often described as a filler
